

## DEPLOY A WEB APPICATION USING KUBERNETES

### 1. Start Minikube:

- Run `minikube start` to start your local Kubernetes cluster.

### 2. Navigate to the Deployment Directory:

- Go to the directory containing your YAML files:

```
bash
CopyEdit
cd ~/Devops/kubernetes/deploy/yaml/apache_phpadmin_mysql/PHPMYADMIN_MYSQL
```

### 3. Apply Namespace:

- Apply the `namespace.yaml` configuration:

```
bash
CopyEdit
kubectl apply -f namespace.yaml
```

### 4. Deploy Resources in the Namespace:

- Apply the resources in the `lampdemo` namespace:

```
bash
CopyEdit
kubectl apply -n lampdemo -k ./
```

### 5. Check Pods:

- Verify that the pods are running:

```
bash
CopyEdit
kubectl get po -n lampdemo
```

### 6. Check Services:

- Check the services to get the external IP and port for access:

```
bash
CopyEdit
kubectl get svc -n lampdemo
```

## 7. Access the Service:

- Open the service URL in your browser:

```
bash
CopyEdit
minikube service lamp -n lampdemo
```

## 8. Verify:

- Ensure that the service is accessible at the URL provided (e.g., <http://127.0.0.1:35141>).

## OUTPUT:

```
swathika@SwathikaM: ~/devops
swathika@SwathikaM:~/devops$ cd ku*
swathika@SwathikaM:~/devops/kubernetes$ minikube start
🐳 minikube v1.35.0 on Ubuntu 24.04 (amd64)
🌟 Using the docker driver based on existing profile
🔥 Starting "minikube" primary control-plane node in "minikube" cluster
📡 Pulling base image v0.0.46 ...
🔄 Restarting existing docker container for "minikube" ...
📡 Preparing Kubernetes v1.32.0 on Docker 27.4.1 ...
🔍 Verifying Kubernetes components...
   ▪ Using image gcr.io/k8s-minikube/storage-provisioner:v5🌟 Enabled addons: storage-provisioner, default-storageclass
🏠 Done! kubectrl is now configured to use "minikube" cluster and "default" namespace by default
